1 Foreword

1.1 Notes on the documentation

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with the applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning the components.

It is the duty of the technical personnel to use the documentation published at the respective time of each installation and commissioning.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement. No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

Trademarks

Beckhoff[®], TwinCAT[®], EtherCAT[®], Safety over EtherCAT[®], TwinSAFE[®], XFC[®] and XTS[®] are registered trademarks of and licensed by Beckhoff Automation GmbH.

Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

Patent Pending

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents:

EP1590927, EP1789857, DE102004044764, DE102007017835

with corresponding applications or registrations in various other countries.

The TwinCAT Technology is covered, including but not limited to the following patent applications and patents:

EP0851348, US6167425 with corresponding applications or registrations in various other countries.

1.2 Safety instructions

Safety regulations

Please note the following safety instructions and explanations! Product-specific safety instructions can be found on following pages or in the areas mounting, wiring, commissioning etc.

Exclusion of liability

All the components are supplied in particular hardware and software configurations appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

Personnel qualification

This description is only intended for trained specialists in control, automation and drive engineering who are familiar with the applicable national standards.

Description of symbols

In this documentation the following symbols are used with an accompanying safety instruction or note. The safety instructions must be read carefully and followed without fail!

| DANGER | Serious risk of injury! Failure to follow the safety instructions associated with this symbol directly endangers the life and health of persons. |
|------------------|---|
| WARNING | Risk of injury! Failure to follow the safety instructions associated with this symbol endangers the life and health of persons. |
| | Personal injuries! Failure to follow the safety instructions associated with this symbol can lead to injuries to persons. |
| Attention | Damage to the environment or devices Failure to follow the instructions associated with this symbol can lead to damage to the environment or equipment. |
| i Note | Tip or pointer This symbol indicates information that contributes to better understanding. |

2 Overview

In many applications it is necessary to synchronise two or more axes. Axes can be coupled together in the TwinCAT NC PTP. A master axis is then actively controlled, and the position of one or more coupled slave axes is synchronously controlled by the NC.

The simplest type of coupling is linear coupling with a fixed ratio of transmission (an electronic gearbox).

Some applications require a more complex coupling of master and slave, one which can not be described by a simple mathematical formula. Such a dependency can be described by means of a table that specifies an associated slave position for every master position.

The TwinCAT NC PTP offers the possibility of coupling a slave axis to a master axis by means of a table (electronic cam plate) Here the table contains a certain number of prescribed reference points, and the NC interpolates position and speed between them.

The TcMC2_Camming library contains function blocks for handling cam plates. Two types of cam plates are supported.

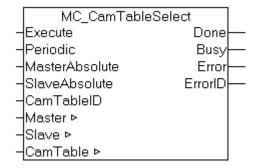

One option is a cam plate in the form of a 2-column table containing master and slave positions (standard table). The master column defines interpolation points via the travel path of the master, ascending from a minimum position value to a maximum value. The associated slave position is determined from the second column using the interpolation points of the table. Values between these points are interpolated.

Another option is to define a cam plate as a so-called motion function. A motion function is a single-column table of interpolation points. Each interpolation point not only contains a position, but a complete description of the shape of the curve within a section (segment) of the cam plate. In addition to the master and slave position at the start of the segment, the shape of the function for example is specified up to the next interpolation point in the form of a mathematical function. Using this procedure, a motion function requires only very few interpolation points. Despite this, each point between the interpolation points is precisely defined through the mathematical function, and there are no uncertainties due to interpolation.

Unlike a standard table, the points of a motion function can be manipulated at run time. The system ensures that a manipulation only becomes effective once an alteration has no direct influence on the slave. Position jumps are thus avoided.

3 Cam plates

3.1 MC_CamTableSelect

With the function block *MC_CamTableSelect*, a table can be specified and loaded into the NC. The block creates a new table and simultaneously fills it with data provided by the PLC.

MC_CamTableSelect does not have to be used, if a table created with the TwinCAT cam plate editor is to be used. In this case, simple coupling with <u>MC_CamIn [> 12]</u> is sufficient.

Inputs

```
VAR_INPUT
Execute : BOOL;
Periodic : BOOL;
MasterAbsolute : BOOL;
SlaveAbsolute : BOOL;
CamTableID : MC_CAM_ID;
END VAR
```

| Execute | The command is executed with a rising edge at input <i>Execute</i> . |
|----------------|--|
| Periodic | Periodic is TRUE if the cam plate is repeatedly cyclically. |
| MasterAbsolute | At the moment not in use. |
| SlaveAbsolute | At the moment not in use. |
| CamTableID | ID of the cam plate used for coupling |

Outputs

```
VAR_OUTPUT
Done : BOOL;
Busy : BOOL;
Error : BOOL;
ErrorID : UDINT;
```

END_VAR

| Done Becomes TRUE, if the cam plate was created successfully. | |
|---|---|
| Busy The <i>Busy</i> output becomes TRUE when the command is started with <i>Exe</i> and remains TRUE as long as the command is processed. When <i>Busy</i> b FALSE again, the function block is ready for a new command. At the sar one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. |

Inputs/outputs

```
VAR_IN_OUT
Master : AXIS_REF;
Slave : AXIS_REF;
```

```
CamTable : MC_CAM_REF;
END_VAR
```

| Master Axis data structure of the master - currently not used. | |
|--|--|
| Slave | Axis data structure of the slave - currently not used. |
| | The data structure of type <u>MC CAM REF [\blacktriangleright 52]</u> describes the data storage for the cam plate in the PLC |

3.2 MC_CamOut

| Γ | MC_Ca | .mOut |
|-----|---------|-----------|
| - E | Execute | Done – |
| | Options | Busy- |
| | Slave Þ | Error— |
| L | | ErrorID — |

The function block MC_CamOut deactivates a master-slave coupling.

Note: If a slave axis is uncoupled during the movement, it is not automatically stopped, but reaches a continuous velocity with which it will continue to travel endlessly. The axis can be stopped with a Stop command.

Call during movement

If the Set Point Generator Type is set to '7 *Phases (optimized)*', the slave axis will reduce its acceleration to zero after it is being decoupled and it will then continue moving endless at constant velocity. The decoupled axis will not be positioned to any target position. The behavior is comparable to a move commanded by MC_MoveVelocity. With TwinCAT 2.10 the set point generator type is selectable. From TwinCAT 2.11 the setting is fixed to '7 *Phases (optimized)*'. If a project is upgraded from TwinCAT 2.10 to TwinCAT 2.11, the behavior will be as described here. After updating an existing application to TwinCAT 2.11, it might be necessary to adapt the PLC program:

Inputs

| VAR_ | INPUT | | |
|------|---------|---|--------------------|
| | Execute | : | BOOL; |
| | Options | : | ST GearOutOptions; |
| END_ | VAR | | |

| Execute The command is executed with a rising edge at input <i>Execute</i> . | |
|---|---------------------------|
| Options | Currently not implemented |

Outputs

VAR_OUTPUT Done : BOOL; Busy : BOOL; Error : BOOL; ErrorID : UDINT; END VAR

| Done Becomes TRUE, if the axis was successfully uncoupled. | |
|--|---|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. |
| Error Becomes TRUE, as soon as an error occurs. | |
| ErrorID If the error output is set, this parameter supplies the error number | |

Inputs/outputs

VAR_IN_OUT Slave : AXIS_REF; END_VAR

Slave

Slave axis data structure.

3.3 MC_CamIn

| MC_0 | Camln |
|----------------|----------------|
| -Execute | InSync— |
| -MasterOffset | Busy- |
| -SlaveOffset | Active- |
| -MasterScaling | CommandAborted |
| -SlaveScaling | Error- |
| -StartMode | ErrorID- |
| -CamTableID | |
| -BufferMode | |
| -Options | |
| -Master ⊳ | |
| –Slave ⊳ | |

The function block *MC_CamIn* activates master-slave coupling with a certain cam plate. In addition it is possible to switch to a new cam plate in coupled state. The switching rules, in particular the time or position, can be specified.

The status flag Axis.Status.CamTableQueued can be used to check whether a cam plate is queued for switchover.

| MasterScaling | Scaling of the master pos | ition of the cam plate | | |
| SlaveScaling | Scaling of the slaveposition | on of the cam plate | | |
| StartMode <u>StartMode [] 67]</u> determines whether the cam plate position or relative to the coupling position. StartMode can be relative or absolute for master (X coordinate). | | position. | | |
| CamTableID | ID [▶ 51] of the cam plate | used for coupling | | |
| BufferMode | currently not implemented | 1 | | |
| Options | Data structure [] 68] with further coupling and switching options: | | | |
| | ActivationMode | ActivationMode [▶_53] specifies the switching time or position at which cam plate coupling or switchover takes place. ActivationMode can also be specified when a slave is coupled for the first time. | | |
| | ActivationPosition | Optional master position at which a cam plate is switched, depending on the <i>ActivationMode</i> . (not required for first coupling.) If <i>ActivationMode</i> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | | |
| | MasterScalingMode : | Optional <u>Scaling mode [▶ 56]</u> for the master position of the cam plate | | |
| | SlaveScalingMode | Optional <u>Scaling mode [▶ 56]</u> for the Slave position of the cam plate | | |
| | InterpolationType | Interpolation type [▶_60] for position tables. Not required for motion functions. | | |

Outputs

| VAR OUTPUT | | |
|----------------|---|--------|
| InSync | : | BOOL; |
| Busy | : | BOOL; |
| Active | : | BOOL; |
| CommandAborted | : | BOOL; |
| Error | : | BOOL; |
| ErrorID | : | UDINT; |
| END_VAR | | |
| | | |

| InSync | Becomes TRUE, if the coupling was successful and the cam plate is active. |
|----------------|---|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>InSync</i> , <i>CommandAborted</i> or <i>Error</i> , is set. |
| Active | Active indicates that the command is executed. For cam plate switching <i>Active</i> becomes TRUE, if the coupling command was executed successfully but the cam plate is still queued. If the cam plate is activated depending on the <i>ActivationMode</i> , <i>Active</i> becomes FALSE and <i>InSync</i> is set. |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. The axis may have become decoupled during the coupling process (simultaneous command execution). |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

```
VAR_IN_OUT
Master : AXIS_REF;
Slave : AXIS_REF;
END_VAR
```

| Master | Master axis data structure. |
|--------|-----------------------------|
| Slave | Slave axis data structure. |

3.4 MC_CaminAppendix

The function block <u>MC_CamIn [> 12]</u> can be used to establish a cam plate coupling (or table coupling) between a master axis and a slave axis. Note that prior to the coupling the slave axis has to be at a position defined by the cam plate. After the coupling and once the master has been started, the slave position is calculated directly from the cam plate. The slave axis is therefore not slowly synchronised with the cam plate, but it will jump if it is not already at the table position.

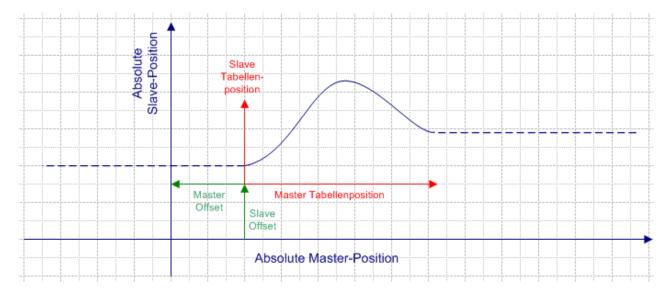

In practice the question arises what position the slave should be in prior to the coupling, and how this is calculated. The following figures illustrate the procedure.

Notes: For all subsequent calculations only axis set positions are used. The actual positions are not used in the calculations, since they would lead to calculation errors, particularly with cyclic cam plates.

Only absolute table couplings are considered. For relative couplings, the coupling position of the master or slave axis is considered in the calculations as an additional offset.

Linear cam plates

A linear cam plate is only defined via a limited master position range. Outside this range the slave position is defined by the first or last table position. The slave therefore stops at the table edges as soon as the master leaves the defined range.

The diagram shows that the absolute axis coordinate system (blue) does not have to be identical to the cam plate coordinate system (red). The cam plate coordinate system may be offset by a master offset or a slave offset. Scaling is also possible.

The slave position relating to a certain master position can be determined via the function block <u>MC ReadCamTableSlaveDynamics</u> [\blacktriangleright 43]. The block refers to the raw table data, which means that offsets and scaling factors have to be considered via the PLC program itself. Initially, the master offset is added to the current master position. If the cam plate is to be scaled, it is divided by this scaling factor.

MasterCamTablePosition := (MasterPosition + MasterOffset) / MasterScaling;

The master table position is used as input parameter for the function block <u>MC_ReadCamTableSlaveDynamics</u> [\blacktriangleright <u>43</u>]. The result is converted to an absolute slave position with slave offset and scaling, if necessary.

SlaveCamTablePosition := ReadSlaveDynamics.SlavePosition;

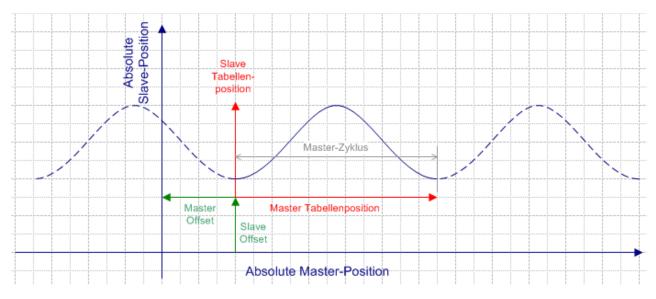

SlavePosition := (SlaveCamTablePosition * SlaveScaling) + SlaveOffset;

The slave is moved to this position prior to the coupling. Alternatively, the master may be moved to a position that corresponds to the current slave position. However, generally this position cannot be determined from the cam plate, since the cam plate may be ambiguous.

Note: Since the master offset is added in the first formula, a positive offset leads to the cam plate coordinate system being shifted to the left in negative direction. Accordingly, the master offset in the diagram is negative. A positive slave offset leads to the cam plate coordinate system being shifted upwards in positive direction.

Cyclic cam plates without lift

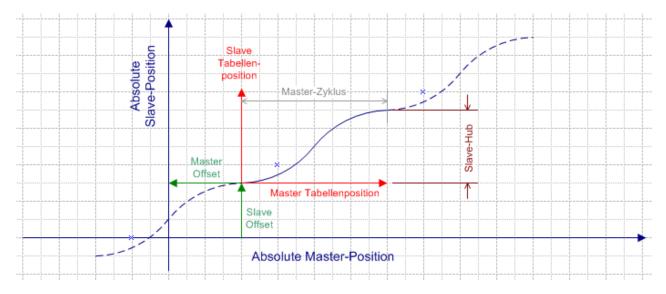

A cyclic cam plate without lift is characterised by the fact that the slave start and end positions in the table are identical. The slave therefore moves cyclically within a defined range, without changing its position permanently in a particular direction.

For these cam plate types, master/slave coupling requires the same preparation as for a linear cam plate. The starting position of the slave can therefore be calculated as described above. It is not necessary to use the modulo position of the master for the calculation, since the absolute position is already correctly taken into account via the coupling command.

Cyclic cam plates with lift

The lift of a cyclic cam plate is the difference between the last and the first table position of the slave.

Such a cam plate is continued cyclically at the end of the table. The slave position does not jump back to the initial table value. Instead, the motion continues steadily. With each new cycle, the lift is therefore added as an additional internal slave offset or subtracted if the motion is reversed.

Uncoupling and re-coupling for cyclic cam plates with lift

If a slave is coupled to a cam plate with lift, the coupling is always done in the basic cycle (red coordinate system), i.e. without added lifting distances. If the slave is uncoupled after a few cycles and then re-coupled, the slave position returns to the basic cycle. If necessary, this behaviour has to be taken into account and compensated by re-calculating the slave offset.

MasterCamTablePos := (MasterPosition + MasterOffset) / MasterScaling;

The master table position is used as input parameter for the function block <u>MC_ReadCamTableSlaveDynamics</u> [$\underbrace{43}$]. The result is converted to an absolute slave position with slave offset and scaling, if necessary. In addition, the number of pending lifts must be calculated and added to the slave position.

SlaveCamTablePosition := ReadSlaveDynamics.SlavePosition;

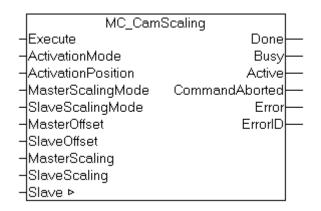

Lift number := MODTURNS((SlavePosition - SlaveOffset), SlaveHub);

NewSlaveOffset := SlaveOffset + (SlaveHub * lift number);

SlavePosition := (SlaveCamTablePosition * SlaveScaling) + NewSlaveOffset;

The <u>Autooffset [> 56]</u> function can simplify the calculation of offsets, particularly for switching of cam plates.

3.5 MC_CamScaling

A cam plate coupling can be scaled with the function block *MC_CamScaling*. The raw table data of the cam plate are not affected, however the scaling refers to an existing master/slave coupling. The following parameters can be modified: scaling factors for master and slave, and offsets for the cam plate within the coordinate system.

Optionally, the modification will only take effect from a certain master position, enabling precise scaling during the motion. Caution when scaling during motion! The slave position at the time of scaling should only be affected slightly by the change.

The status flag Axis.Status.CamScalingPending (AXIS_REF) can be used to check whether a scaling procedure is queued.

Inputs

| VAR_INPUT | |
|--------------------|-------------------------|
| Execute | : BOOL; |
| ActivationMode | : MC CamActivationMode; |
| ActivationPosition | : LREAL; |
| MasterScalingMode | : MC CamScalingMode; |
| SlaveScalingMode | : MC CamScalingMode; |
| MasterOffset | : LREAL; |
| SlaveOffset | : LREAL; |
| MasterScaling | : LREAL := 1.0; |
| SlaveScaling | : LREAL := 1.0; |
| | |

| END | VAR |
|-----|-----|
| | |
| | |

| Execute | The command is executed with a rising edge at input <i>Execute</i> . |
|--------------------|--|
| ActivationMode | <u>ActivationMode [▶ 53]</u> specifies the scaling time and position. |
| ActivationPosition | Master position at which a cam plate is scaled, depending on the <u>ActivationMode</u> [▶ <u>53</u>]. If <i>ActivationMode</i> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| MasterScalingMode | optional <u>Scaling mode [▶ 56]</u> for the master position of the cam plate |
| SlaveScalingMode | optional <u>Scaling mode [▶ 56]</u> for the slave position of the cam plate |
| MasterOffset | Offset to the master position of the cam plate |
| SlaveOffset | Offset to the slave position of the cam plate |
| MasterScaling | Scaling of the master position of the cam plate |
| SlaveScaling | Scaling of the slave position of the cam plate |

Outputs

| VAR_OUTPUT | | |
|----------------|---|--------|
| Done | : | BOOL; |
| Busy | : | BOOL; |
| Active | : | BOOL; |
| CommandAborted | : | BOOL; |
| Error | : | BOOL; |
| ErrorID | : | UDINT; |
| END VAR | | |

| Done | Becomes TRUE if scaling was successful. |
|----------------|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. If <i>Busy</i> becomes FALSE again, the function block is ready for a new job. At the same time one of the outputs, <i>Done</i> , <i>CommandAborted</i> or <i>Error</i> , is set. |
| Active | Active indicates that the command is executed. When the scaling was done depending on <i>ActivationMode</i> , <i>Active</i> becomes FALSE and <i>Done</i> is set. |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

Inputs/outputs

VAR_IN_OUT Slave END_VAR

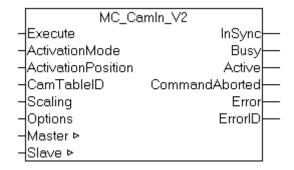

: AXIS_REF;

Slave

Axis data structure of the Slave.

4 Multi cam plates

4.1 MC_CamIn_V2

 MC_CamIn_V2 is a further development of the function block $MC_CamIn_[\blacktriangleright 12]$ and is able to operate with several superimposed cam plates (Multi-Cam). When MC_CamIn_V2 is first called it creates a master/slave coupling with the cam plate. Subsequent calls during runtime can be used to superimpose additional cam plates for the same slave axis or remove them again. The switching rules, in particular the time or position, can be specified.

 MC_CamIn_V2 can only be used as an alternative to MC_CamIn . The two function blocks cannot be used together for the same slave axis. For addition, replacement and removal of cam plates the function blocks <u>MC CamAdd [> 23]</u>, <u>MC CamExchange [> 26]</u> and <u>MC CamRemove [> 29]</u> are available as alternatives. All operations can also be carried out with MC_CamIn_V2 .

The status flag Axis.Status.CamTableQueued (AXIS_REF) can be used to check whether a cam plate is queued for addition or switchover.

The block can be used from a runtime version TwinCAT 2.11 R2

Important :

<u>ActivationMode [> 53]</u> (time and/or position from which the operation takes place)

<u>CamOperationMode</u> [<u>69</u>] (adding, switching or removal of superimposed cam plates)

<u>ScalingMode</u> [▶ <u>56</u>]

Inputs

```
VAR_INPUT
Execute : BOOL;
ActivationMode : MC_CamActivationMode := MC_CAMACTIVATION_INSTANTANEOUS;
ActivationPosition : LREAL;
CamTableID : MC_CAM_ID;
Scaling : ST_CamScalingData;
Options : ST_CamInOptions_V2;
END VAR
```

| Execute | The command is executed with a rising edge at input <i>Execute</i> . | |
|--------------------|---|---|
| ActivationMode | The <u>ActivationMode i [] 53]</u> s used to specify the time and/or position at which the cam plate coupling or switchover is to take place. <i>ActivationMode</i> can also be specified when a slave is coupled for the first time. | |
| ActivationPosition | Optional master position at which a cam plate is switched, depending on the <i>ActivationMode</i> . (not required for first coupling.) If <i>ActivationMode</i> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | |
| CamTableID | ID [> 51] of the cam plate used for the coupling | |
| Scaling | Optional scaling parameters [70] for the cam plate | |
| Options | Data structure with further coupling and switching options: | |
| | Interpolation type | Interpolation type [▶ 60] for position tables. Not required for motion functions. |
| | CamOperationMode | The <u>CamOperationMode [▶ 69]</u> defines the way the specified cam plate (<i>CamTableID</i>) has to act in the coupled system. Cam plates can be added, switched or removed. |
| | ReferenceCamTableID | Optional ID of a cam plate that is already active in the coupling. This ID is specially required for operations that would otherwise be ambiguous, e.g. replacement of certain cam plates in multi- couplings. In unambiguous operations the value can remain 0. |

Outputs

| VAR OUTPUT | |
|-----------------|-------|
| InSync: | BOOL; |
| Busy: | BOOL; |
| Active: | BOOL; |
| CommandAborted: | BOOL; |
| Error: | BOOL; |
| ErrorID: | UDINT |
| END_VAR | |
| | |

| InSync | Becomes TRUE if the cam plate operation was completed successfully. In operations with activation position InSync only becomes TRUE after the actual activation. |
|----------------|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs <i>InSync</i> , <i>CommandAborted</i> or <i>Error</i> is set. |
| Active | Active indicates that the command is executed. Active becomes TRUE if the command was issued successfully but the operation is still queued. If the cam plate is activated depending on the ActivationMode, Active becomes FALSE and InSync is set. |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. The axis may have become decoupled during the coupling process (simultaneous command execution). |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

| -ActivationMode | Busy- | _ |
| -ActivationPosition | Active- | _ |
| -CamTableID | CommandAborted | _ |
| -Scaling | Error- | _ |
| -Options | ErrorID- | _ |
| -Master ⊳ | | |
| –Slave ⊳ | | |

MC_CamAdd adds a cam plate to a multi-cam coupling. The cam plate coupling is initially created with <u>MC_CamIn V2 [\triangleright 20]</u>.

Alternatively, a cam plate can be added with MC_CamIn_V2.

The status flag *Axis.Status.CamTableQueued* (AXIS_REF)can be used to check whether a cam plate is queued for addition or switchover.

The block can be used from a runtime version TwinCAT 2.11 R2

Important :

<u>ActivationMode [> 53]</u> (time and/or position from which the operation takes place)

<u>CamOperationMode</u> [<u>69</u>] (adding, switching or removal of superimposed cam plates)

ScalingMode [▶ 56]

Inputs

| VAR_INPUT | |
|--------------------|---|
| Execute | : BOOL; |
| ActivationMode | : MC CamActivationMode := MC CAMACTIVATION INSTANTANEOUS; |
| ActivationPosition | : LREAL; |
| CamTableID | : MC CAM ID; |
| Scaling | : ST CamScalingData; |
| Options | : ST CamInOptions V2; |
| END_VAR | |

| Execute | The command is executed | with a rising edge at input Execute. | |
|--------------------|---|--|--|
| ActivationMode | The <u>ActivationMode [> 53]</u> is used to specify the time and/or position at which the cam plate coupling or switchover is to take place. <i>ActivationMode</i> can also be specified when a slave is coupled for the first time. | | |
| ActivationPosition | Optional master position at which a cam plate is switched, depending on the <i>ActivationMode</i> . (not required for first coupling.) If <i>ActivationMode</i> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | | |
| CamTableID | ID [▶ 51] of the cam plate used for the coupling | | |
| Scaling | Optional scaling parameters [70] for the cam plate | | |
| Options | Data structure with further coupling and switching options: | | |
| | Interpolation type | Interpolation type [▶ 60] for position tables. Not required for motion functions. | |
| | CamOperationMode | For MC_CamAdd theCamOperationMode [> 69] is preallocated with CAMOPERATIONMODE_ADDITIVE. | |
| | ReferenceCamTableID | Optional ID of a cam plate that is already active in the coupling. This ID is only required for operations that would otherwise be ambiguous, e.g. automatic offset adjustment in relation to an existing cam plate (Master AutoOffset). | |

Outputs

| VAR_OUTPUT | | |
|----------------|---|--------|
| InSync | : | BOOL; |
| Busy | : | BOOL; |
| Active | : | BOOL; |
| CommandAborted | : | BOOL; |
| Error | : | BOOL; |
| ErrorID | : | UDINT; |
| END VAR | | |
| _ | | |
| | | |

| InSync | Becomes TRUE if the cam plate operation was completed successfully. In operations with activation position InSync only becomes TRUE after the actual activation. |
|----------------|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs <i>InSync</i> , <i>CommandAborted</i> or <i>Error</i> is set. |
| Active | Active indicates that the command is executed. Active becomes TRUE if the command was issued successfully but the operation is still queued. If the cam plate is activated depending on the ActivationMode, Active becomes FALSE and InSync is set. |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. The axis may have become decoupled during the coupling process (simultaneous command execution). |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number |

Inputs/outputs

VAR_IN_OUT Master

: AXIS_REF;

| Slave | |
|---------|--|
| end_var | |

: AXIS_REF;

| Master | Master axis data structure. |
|--------|-----------------------------------|
| Slave | Axis data structure of the Slave. |

4.3 MC_CamExchange

| CamExcha | nge |
|----------------------|----------------|
| MC_CamExcl | nange |
| -Execute | InSync- |
| -ActivationMode | Busy- |
| -ActivationPosition | Active |
| -CamTableID | CommandAborted |
| -ReferenceCamTableID | Error |
| -Scaling | ErrorID- |
| -Options | |
| -Master ⊳ | |
| –Slave ⊳ | |

MC_CamExchange exchanges a cam plate in a multi-cam coupling. The cam plate coupling is initially created with <u>MC CamIn V2 [> 20]</u>.

Alternatively, a cam plate can be exchanged with MC_CamIn_V2.

The status flag *Axis.Status.CamTableQueued* (AXIS_REF)can be used to check whether a cam plate is queued for addition or switchover.

The block can be used from a runtime version TwinCAT 2.11 R2

Important :

ActivationMode [53] (time and/or position from which the operation takes place)

<u>CamOperationMode</u> [<u>69</u>] (adding, switching or removal of superimposed cam plates)

ScalingMode [56]

Inputs

```
VAR_INPUT
    Execute : BOOL;
ActivationMode : MC_CamActivationMode := MC_CAMACTIVATION_INSTANTANEOUS;
ActivationPosition : LREAL;
CamTableID : MC_CAM_ID;
    ReferenceCamTableID: MC_CAM_ID;
Scaling : ST_CamScalingData;
Options : ST_CamInOptions_V2;
END_VAR
```

| Execute | The command is executed with a rising edge at input <i>Execute</i> . | | |
|---------------------|--|---|--|
| ActivationMode | The <u>ActivationMode [\blacktriangleright 53]</u> is used to specify the time and/or position at which the cam plate coupling or switchover is to take place. <u>ActivationMode [\blacktriangleright 53] can also be specified when a slave is coupled for the first time.</u> | | |
| | | | |
| ActivationPosition | Optional master position at which a cam plate is switched, depending on the ActivationMode [▶ 53]. | | |
| | (not required for first couplin | a.) | |
| | If <u>ActivationMode [> 53]</u> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | | |
| CamTableID | ID [51] of the cam plate us | ed for the coupling | |
| ReferenceCamTableID | Optional ID of a cam plate that is already active in the coupling. This ID is specially required for operations that would otherwise be ambiguous, e.g. replacement of certain cam plates in multi-couplings. In unambiguous operations the value can remain 0. | | |
| Scaling | Optional scaling parameters [70] for the cam plate | | |
| Options | Data structure with further c | oupling and switching options: | |
| | Interpolation type | Interpolation type [▶ 60] for position tables. Not required for motion functions. | |
| | CamOperationMode | ForMC_CamExchange the CamOperationMode [▶ 69] is preallocated with CAMOPERATIONMODE_EXCHANGE. | |
| | ReferenceCamTableID | is preallocated with the value of input ReferenceCamTableID | |

Outputs

VAR_OUTPUT InSync : BOOL; Busy : BOOL; Active : BOOL; CommandAborted : BOOL; Error : BOOL; ErrorID : UDINT; END_VAR

| InSync | Becomes TRUE if the cam plate operation was completed successfully. In operations with activation position InSync only becomes TRUE after the actual activation. |
|----------------|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs <i>InSync</i> , <i>CommandAborted</i> or <i>Error</i> is set. |
| Active | Active indicates that the command is executed. Active becomes TRUE if the command was issued successfully but the operation is still queued. If the cam plate is activated depending on the <u>ActivationMode [\blacktriangleright_53]</u> , Active becomes FALSE and <i>InSync</i> is set. |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. The axis may have become decoupled during the coupling process (simultaneous command execution). |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

Inputs/outputs

VAR_IN_OUT Master : AXIS_REF; Slave : AXIS_REF; END_VAR

| Master | Master axis data structure. |
|--------|-----------------------------------|
| Slave | axis data structure of the Slave. |

4.4 MC_CamRemove

| MC_Can | MC_CamRemove | | |
|---------------------|----------------|--|--|
| -Execute | Done | | |
| -ActivationMode | Busy | | |
| -ActivationPosition | CommandAborted | | |
| -CamTableID | Active | | |
| -Options | Error | | |
| -Master ⊳ | ErrorID | | |
| –Slave ⊳ | | | |

MC_CamRemove removes a cam plate from a multi-cam coupling. The cam plate coupling is initially created with <u>MC_CamIn_V2 [> 20]</u>.

Alternatively, a cam plate can be removed with MC_CamIn_V2.

The block can be used from a runtime version TwinCAT 2.11 R2

Important :

<u>ActivationMode [> 53]</u> (time and/or position from which the operation takes place)

Inputs

| Execute | The command is executed with a rising edge at input <i>Execute</i> . | |
|---|---|--|
| ActivationMode The ActivationMode [▶ 53] is used to specify the time and/or position the cam plate coupling or switchover is to take place. ActivationMode [▶ 53] can also be specified when a slave is coupled time. | | |
| ActivationPosition | Optional master position at which a cam plate is switched, depending on the <u>ActivationMod [\blacktriangleright 53]</u> <i>e</i> . (not required for first coupling.) If <u>ActivationMode [\blacktriangleright 53]</u> <i>MC_CAMACTIVATION_ATMASTERCAMPOS</i> is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | |
| CamTableID | ID [▶_51] of the cam plate that is removed from the coupled system. | |
| Options | not used | |

Outputs

| VAR OUTPUT | |
|-----------------|--------|
| Done: | BOOL; |
| Busy: | BOOL; |
| Active: | BOOL; |
| CommandAborted: | BOOL; |
| Error: | BOOL; |
| ErrorID: | UDINT; |
| END_VAR | |
| | |

| Done | Becomes TRUE if the cam plate operation was completed successfully. In operations with activation position Done only becomes TRUE after the actual deactivation. | |
|----------------|--|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs <i>InSync</i> , <i>CommandAborted</i> or <i>Error</i> is set. | |
| Active | Active indicates that the command is executed. Active becomes TRUE if the command was issued successfully but the operation is still queued. If the cam plate is activated depending on the <u>ActivationMode [] 53]</u> , Active becomes FALSE and <i>InSync</i> is set. | |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. The axis may have become decoupled during the coupling process (simultaneous command execution). | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

Inputs/outputs

```
VAR_IN_OUT
Master : AXIS_REF;
Slave : AXIS_REF;
END_VAR
```

| Master | Master axis data structure. |
|--------|-----------------------------------|
| Slave | Axis data structure of the Slave. |

4.5 MC_CamScaling_V2

| MC_CamScaling_V2 | | |
|---------------------|----------------|--|
| -Execute | Done | |
| -ActivationMode | Busy | |
| -ActivationPosition | Active | |
| -CamTableID | CommandAborted | |
| -Scaling | Error | |
| -Options | ErrorID | |
| –Slave ⊳ | | |

A cam plate coupling can be scaled with the function block *MC_CamScaling_V2*. The raw table data of the cam plate are not affected, however the scaling refers to an existing master/slave coupling. The following parameters can be modified: scaling factors for master and slave, and offsets for the cam plate within the coordinate system.

Optionally, the modification will only take effect from a certain master position, enabling precise scaling during the motion. Caution when scaling during motion! The slave position at the time of scaling should only be affected slightly by the change.

The status flag Axis.Status.CamcalingPending (AXIS_REF) can be used to check whether a scaling procedure is queued.

The block can be used from a runtime version TwinCAT 2.11 R2

Inputs

```
VAR_INPUT
Execute : BOOL;
ActivationMode : MC_CamActivationMode;
ActivationPosition : LREAL;
CamTableID : MC_CAM_ID;
Scaling : ST_CamScalingData;
Options : ST_CamScalingOptions_V2;
END_VAR
```

| Execute | The command is executed with a rising edge at input <i>Execute</i> . | |
|--------------------|--|--|
| ActivationMode | ActivationMode [> 53] specified the scaling time and position. | |
| ActivationPosition | Master position at which a cam plate is scaled, depending on the <u>ActivationMode [> 53]</u> If <u>ActivationMode [> 53]</u> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. | |
| CamTableID | ID [▶_51] of the cam plate that is scaled. | |
| Scaling | Scaling data such as mode, offset and scaling factor | |
| Options | not used | |

Outputs

| VAR OUTPUT | |
|-----------------|--------|
| Done: | BOOL; |
| Busy: | BOOL; |
| Active: | BOOL; |
| CommandAborted: | BOOL; |
| Error: | BOOL; |
| ErrorID: | UDINT; |
| END_VAR | |

| Done | Becomes TRUE if scaling was successful. | |
|----------------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done, CommandAborted</i> or <i>Error</i> , is set. | |
| Active | Active indicates that the command is executed. When the scaling was done depending on <u>ActivationMode [▶_53]</u> , <i>Active</i> becomes FALSE and <i>Done</i> is set. | |
| CommandAborted | Becomes TRUE, if the command could not be fully executed. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

Inputs/outputs

VAR_IN_OUT Slave : AXIS_REF; END_VAR

Slave

Axis data structure of the Slave.

5 Motion functions

5.1 MC_ReadMotionFunction

| | MC_ReadMotionFunction | | |
|---|-----------------------|---------------|--|
| - | Execute | Done | |
| _ | CamTableID | Busy | |
| _ | PointID | Error | |
| _ | NumPoints | ErrorID | |
| - | CamTable ⊳ | NumPointsRead | |

The function block *MC_ReadMotionFunction* can be used to read the data of a motion function. Either the complete function with all interpolation points or only a part can be read. The data are stored within the PLC in the structure described by <u>CamTable [> 52]</u>.

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
PointID : MC_MotionFunctionPoint_ID;
NumPoints : UDINT; (* 0 = fill MFsize *)
END VAR
```

| Execute | The command is executed with rising edge. | |
|------------|--|--|
| CamTableID | <u>ID [▶ 51]</u> of the loaded table. | |
| PointID | Point ID $[\blacktriangleright 62]$ of the first point of the motion function to be read. | |
| | Number of motion function points to be read. For reading all points, 0 can be specified here, in which case the number that is actually read is returned in the output variable <i>NumPointsRead</i> . | |

Outputs

```
VAR_OUTPUT

Done: BOOL;

Busy: BOOL;

Error: BOOL;

ErrorID: UDINT;

NumPointsRead: UDINT; (* return value <= NumPoints *)

END_VAR
```

| Done | Becomes TRUE, if the data were read successfully. | |
|---------------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |
| NumPointsRead | The number of points that were actually read. The number may be less or equal <i>NumPoints</i> . | |

Inputs/outputs

VAR_IN_OUT CamTable : MC_CAM_REF; END_VAR

CamTable

<u>Reference to the table [▶ 52]</u> (structure).

5.2 MC_ReadMotionFunctionPoint

| | MC_ReadMotionFunctio | nPoint | |
|---|----------------------|---------|--|
| - | Execute | Done | |
| _ | CamTableID | Busy | |
| - | PointID | Error | |
| _ | Point ⊳ | ErrorID | |

The function block *MC_ReadMotionFunctionPoint* can be used to read the data of a motion function interpolation point.

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
PointID : MC_MotionFunctionPoint_ID;
END_VAR
```

| Execute | The command is executed with rising edge. | |
|------------|---|--|
| CamTableID | ID [▶_51] of the loaded table. | |
| PointID | Point ID [> 62] of the first point of the motion function to be read. | |

Outputs

| VAR | OUTPUT | |
|-----|----------|--------|
| - | Done: | BOOL; |
| | Busy: | BOOL; |
| | Error: | BOOL; |
| | ErrorID: | UDINT; |
| END | VAR | |

| Done | Becomes TRUE, if the data were read successfully. | |
|---------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> become FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

Inputs/outputs

VAR_IN_OUT Point : MC_MotionFunctionPoint; END_VAR

5.3 MC_WriteMotionFunction

| | MC_WriteMotic | onFunction | |
|---|---------------|------------|--|
| - | Execute | Done | |
| _ | CamTableID | Busy | |
| _ | PointID | Error | |
| _ | NumPoints | ErrorID | |
| _ | CamTable | | |

The function block *MC_WriteMotionFunction* can be used to write the data of a motion function into the NC. Either the complete function with all interpolation points or only a part can be written. First, the data are stored within the PLC in the structure described by <u>CamTable [\triangleright 52].</u>

The function block <u>MC SetCamOnlineChangeMode [>39]</u> can be used to specify when the data are read into the cam plate. If activation of the data is to be delayed until the master reaches a certain position, the system will initially queue the written data and activate them at the master position.

The status flag *Axis.Status.CamDataQueued* (AXIS_REF) can be used to check whether data have been queued (i.e. written but not yet activated).

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
PointID : MC_MotionFunctionPoint_ID;
NumPoints : UDINT;
END_VAR
```

| Execute | The command is executed with rising edge. |
|------------|---|
| CamTableID | ID [▶_51] of the loaded table. |
| PointID | Point ID [62] of the first point of the motion function to be written. |
| NumPoints | Number of motion function points to be written. |

Outputs

```
VAR_OUTPUT
Done: BOOL;
Busy: BOOL;
Error: BOOL;
ErrorID: UDINT;
END_VAR
```

| Done | Becomes TRUE, if the data were read successfully. | |
|---------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

Inputs/outputs

```
VAR_IN_OUT
CamTable : MC_CAM_REF;
END_VAR
```

| CamTable | Reference to the table [52] (structure). The start address of the table data |
|----------|---|
| | structure (CamTable.pArray) indicates the first point to be written. |

5.4 MC_WriteMotionFunctionPoint

| | MC_WriteMotionFunct | ionPoint | |
|---|---------------------|----------|--|
| _ | Execute | Done | |
| _ | CamTableID | Busy | |
| _ | PointID | Error | |
| _ | Point ⊳ | ErrorID | |

The function block *MC_WriteMotionFunctionPoint* can be used to write the data of a motion function interpolation point.

The function block <u>MC_SetCamOnlineChangeMode [> 39]</u> can be used to specify when the data are read into the cam plate. If activation of the data is to be delayed until the master reaches a certain position, the system will initially queue the written data and activate them at the master position.

The status flag *Axis.Status.CamDataQueued* (AXIS_REF)can be used to check whether data have been queued (i.e. written but not yet activated).

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
PointID : MC_MotionFunctionPoint_ID;
END_VAR
```

| Execute | The command is executed with rising edge. |
|------------|--|
| CamTableID | ID [▶_51] of the loaded table. |
| PointID | Point ID [> 62] of the first point of the motion function to be written. |

Outputs

| VAR | OUTPUT | |
|------|----------|--------|
| - | Done: | BOOL; |
| | Busy: | BOOL; |
| | Error: | BOOL; |
| | ErrorID: | UDINT; |
| END_ | VAR | |

| Done | Becomes TRUE, if the data were written successfully. |
|---------|---|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

Inputs/outputs

VAR_IN_OUT Point : MC_MotionFunctionPoint; END_VAR

| Point | Data structure containing the data of a motion function interpolation point |
|-------|---|
| | [<u>61]</u> |

5.5 MC_SetCamOnlineChangeMode

| MC_SetCamOnlineChange | Vlode |
|-----------------------|-----------|
| -Execute | Done – |
| -ActivationMode | Busy- |
| -ActivationPosition | Error- |
| -MasterScalingMode | ErrorID - |
| -SlaveScalingMode | |
| -CamTableID | |
| | |

The function block MC_SetCamOnlineChangeMode specifies the mode for write access to cam plate data.

Cam plate can be modified at run time via the PLC (see MC_WriteMotionFunction

[<u>36],MC_WriteMotionFunctionPoint</u>[<u>38]</u>). The function block *MC_SetCamOnlineChangeMode* is used to specify when and how these changes take effect. The set mode affects all subsequent write operations. It is therefore not necessary to call the block before each write access.

This function specifies the activation mode for modifications but does not affect a change or change-over of cam plates.

Inputs

```
VAR_INPUT
Execute : BOOL;
ActivationMode : MC_CamActivationMode;
ActivationPosition : LREAL;
MasterScalingMode : MC_CamScalingMode;
SlaveScalingMode : MC_CamScalingMode;
CamTableID : MC_CAM_ID;
END_VAR
```

| Execute | The command is executed with rising edge. |
|---------------------|---|
| ActivationMode | Defines when and how scaling takes place . (MC CamActivationMode [> 53]) |
| ActivationPosition | Optional master position at which scaling is carried out (depending on <i>ActivationMode</i>). If <i>ActivationMode</i> MC_CAMACTIVATION_ATMASTERCAMPOS is used, the position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| MasterScalingMode : | Type of master scaling. (MC_CamScalingMode [56]) |
| SlaveScalingMode | Type of slave scaling. (<u>MC_CamScalingMode [▶ 56]</u>) |
| CamTableID | <u>Table ID [▶ 51]</u> . |

Outputs

```
VAR_OUTPUT
Done: BOOL;
Busy: BOOL;
Error: BOOL;
ErrorID: UDINT;
END_VAR
```

| Done | Becomes TRUE when the function has been successfully executed. |
|---------|---|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

5.6 MC_ReadMotionFunctionValues

| MC_ReadMotionFunction | nValues |
|-----------------------|-----------|
| | |
| -Execute | Done – |
| -CamTableID | Busy- |
| -ValueSelectMask | Error- |
| -StartPosMaster | ErrorID – |
| -EndPosMaster | |
| -Increment | |
| -CamTable ⊳ | |

The function block *MC_ReadMotionFunctionValues* can be used to read the interpolated data of a motion function in the form of a table.

This function can be used for visualising a motion function, for example. The complete curve is digitised with a parameterisable step size. The data determined in this way are easier to display then a motion function.

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
ValueSelectMask : UINT; (* MC_ValueSelectType; position, velocity, acceleration, jerk... *)
StartPosMaster : LREAL; (* master position of first point *)
EndPosMaster : LREAL; (* master position of last point *)
Increment : LREAL; (* increment of master position *)
END_VAR
```

| Execute | The command is executed with rising edge. |
|-----------------|---|
| CamTableID | ID [▶ 51] of the loaded table (motion function type). |
| ValueSelectMask | The selection mask can be used to specify which data are to be interpolated and returned. The value is formed through addition of individual values of data type $\underline{MC \ ValueSelectType} \ \underline{b \ 66}$. The number of columns of the data structure described by $\underline{CamTable} \ \underline{b \ 52}$] must match the number of columns defined by $\underline{ValueSelectMask} \ \underline{b \ 66}$. If, for example, only position data are read, the number of columns is 2 (master and slave position). With each further derivative (speed, acceleration, jerk), the number of columns increases by 1. |
| StartPosMaster | Position value of the master axis of the first interpolated point |
| EndPosMaster | Position value of the master axis of the last interpolated point |
| Increment | Interpolation step size |

Outputs

VAR_OUTPUT Done: BOOL; Busy: BOOL; Error: BOOL; ErrorID: UDINT; END_VAR

| Done | Becomes TRUE, if the data were read successfully. |
|---------|---|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |

Inputs/outputs

```
VAR_IN_OUT
CamTable : MC_CAM_REF;
END_VAR
```

| CamTable | Reference to the table [> 52] (structure). |
|----------|--|
|----------|--|

| | SlaveVelocity | |
| | SlaveAcceleration | |

The function block *MC_ReadCamTableSlaveDynamics* can be used to determine the slave dynamics at a certain point of a cam plate table. The function evaluates the raw table data. Any scaling of the cam plate is not taken into account.

For older <u>cam plate table types [\blacktriangleright 66]</u>, not all dynamic parameters can be determined. The following overview shows the expected result:

MC_TABLETYPE_MOTIONFUNCTION : slave position, velocity and acceleration are determined.

MC_TABLETYPE_EQUIDISTANT : slave position and velocity are determined. The acceleration is always 0.

 $\label{eq:mc_table_type_nonequilibration} MC_TABLETYPE_NONEQUIDISTANT: the slave position is determined. Velocity and acceleration are always 0.$

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
MasterPosition : LREAL;
END VAR
```

| Execute | The command is executed with rising edge. | |
|------------|--|--|
| CamTableID | Table ID [<u>51</u>]. | |
| | Master position within the table for which the slave dynamics is to be determined. | |

Outputs

| VAR_OUTPUT | |
|--------------------|--------|
| Done: | BOOL; |
| Busy: | BOOL; |
| SlavePosition: | LREAL; |
| SlaveVelocity: | LREAL; |
| SlaveAcceleration: | LREAL; |
| Error: | BOOL; |
| ErrorID: | UDINT; |
| end_var | |

| Done | Becomes TRUE, if the command was executed successfully. | |
|-------------------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| SlavePosition | Position of the slave within the cam plate table at the specified master position. | |
| SlaveVelocity | Velocity of the slave within the cam plate table at the specified master position. | |
| SlaveAcceleration | Acceleration of the slave within the cam plate table at the specified master position. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

6.2 MC_CamInfo

| MC_CamIn | fo |
|-------------------|-----------|
| -Execute | Done – |
| -AtMasterPosition | Busy- |
| -MasterPosition | Error- |
| –Slave ⊳ | ErrorID- |
| | CamInfo — |

The *MC_CamInfo* function block obtains data relating to the current state and current parameterization of a cam plate coupling. The command assumes that the slave axis is coupled by a cam plate. If the *AtMasterPosition* input is TRUE the state is determined with reference to the quoted master position instead of the current state. The data obtained is placed into the *CamInfo* data structure.

Notice: If the coupled group of axes gets into an error situation (e.g. emergency off), the function block will return the most recent valid state of the coupling. The function block must be called before decoupling the slave. The data that has been obtained can be used to restore the coupling to the original axis position.

Inputs

```
VAR_INPUT
Execute : BOOL;
AtMasterPosition : BOOL;
MasterPosition : LREAL;
END VAR
```

| Execute | The command is executed with rising edge. |
|---------|--|
| | If <i>AtMasterPosition</i> is TRUE the data is determined with reference to the quoted <i>MasterPosition</i> . Otherwise the data refers to the current master position. |
| | Master position to which the data that is determined refers. This input parameter is not necessary if <i>AtMasterPosition</i> is FALSE. |

Outputs

```
VAR_OUTPUT
Done: BOOL;
Busy: BOOL;
Error: BOOL;
ErrorID: UDINT;
CamInfo: MC_CamInfoData;
END_VAR
```

| Done | Becomes TRUE when the function has been successfully executed. | |
|---------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |
| CamInfo | The <u>CamInfo data structure [▶ 59]</u> contains all the data determined about the cam plate coupling. | |

: AXIS_REF;

Axis data structure of the Slave.

Slave

The axis data structure of type AXIS_REF addresses an axis uniquely within the system. Among other parameters it contains the current axis status, including position, velocity or error status.

6.3 MC_ReadCamTableCharacteristics

| M | C_ReadCamTableCharad | cteristics | |
|-------|----------------------|------------|---|
| Exect | ute | Done- | _ |
| -Cam1 | FableID | Busy- | _ |
| -Cam] | FableCharac ⊳ | Error- | _ |
| | | ErrorID - | _ |

The function block *MC_ReadCamTableCharacteristics* is used to calculate and read the characteristic parameters of a motion function. This includes minimum and maximum values of position, velocity, acceleration and jerk.

Inputs

```
VAR_INPUT
Execute : BOOL;
CamTableID : MC_CAM_ID;
END_VAR
```

| Execute | The command is executed with rising edge. |
|------------|---|
| CamTableID | Table <u>ID [▶ 51]</u> |

Outputs

| VAR | OUTPUT | |
|------|----------|--------|
| | Done: | BOOL; |
| | Busy: | BOOL; |
| | Error: | BOOL; |
| | ErrorID: | UDINT; |
| END_ | VAR | |

| Done | Becomes TRUE, if the calculation was carried out successfully. | |
|---------|---|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. | |
| Error | Becomes TRUE, as soon as an error occurs. | |
| ErrorID | If the error output is set, this parameter supplies the error number. | |

Inputs/outputs

```

```

CamTableCharac Data structure [> 65] with characteristic parameters of the motion function

6.4 MC_ReadCamTableMasterPosition

| MC_ReadCamTable | MasterPosition |
|----------------------|----------------|
| -Execute | Done- |
| -CamTableID | Busy- |
| -SlavePosition | Error |
| -MasterOffset | ErrorID- |
| -SlaveOffset | MasterLow- |
| -MasterScaling | MasterHigh |
| -SlaveScaling | - |
| -MasterStartPosition | |
| -MasterAccuracy | |

The function block*MC_ReadCamTableMasterPosition* can be used to calculate the master position for a given slave position. While the slave position for a given master position must be unique, the inverse is not true. In order to limit the number of master output options for the function block, for a given master position (*MasterStartPosition*) the smaller (*MasterLow*) and larger master position (*MasterHigh*) for the slave value is output.

For example, for the cam plate in Fig. 1, for a slave value of 80 and a master start value of 180, the output values are 225 for *MasterHigh* and 135 for *MasterLow*. If the cam plate is cyclic, for a master start value of 90 in addition to the *MasterHigh* of 135 a *MasterLow* of -135 is calculated. In the linear cam plate case (non-cyclic) only the value *MasterHigh* is shown as valid in Fig. 2.

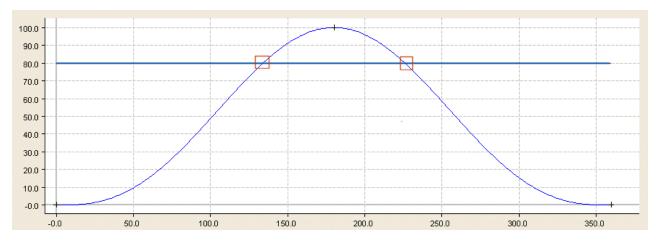

Fig. 1

In cyclic cam plates with hub the master position can not only lie in one of the cycles adjacent to the StartMasterpos, but several cycles further, depending on the slave position.

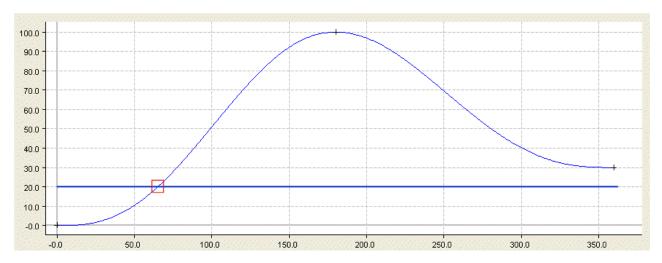

Fig. 2

The master position is calculated with numeric algorithms, the precision of which can be set via the variable *MasterAccuracy*.

Inputs

```
VAR_INPUT
    Execute : BOOL;
CamTableID : MC_CAM_ID;
SlavePosition : LREAL; (* absolute slave axis position *)
MasterOffset : LREAL; (* E *)
SlaveOffset : LREAL; (* E *)
MasterScaling : LREAL := 1.0; (* E *)
SlaveScaling : LREAL := 1.0; (* E *)
MasterStartPosition: LREAL; (* Master position to start the iteration from *)
MasterAccuracy : LREAL; (* Master iteration accuracy *)
END_VAR
```

| Execute | The command is executed with a rising edge at input <i>Execute</i> . | |
|---------------------|--|--|
| CamTableID | ID [▶ 51] of the cam plate for which the calculation is carried out | |
| SlavePosition | The slave position for which the master position is sought | |
| MasterOffset | Offset to the master position of the cam plate | |
| SlaveOffset | Offset to the slave position of the cam plate | |
| MasterScaling | Scaling of the master position of the cam plate | |
| SlaveScaling | Scaling of the slave position of the cam plate | |
| MasterStartPosition | Start position of the master | |
| MasterAccuracy | Precision for the calculation | |

Outputs

```
VAR_OUTPUT
Done: BOOL;
Busy: BOOL;
Active: BOOL;
Error: BOOL;
ErrorID: UDINT;
MasterLow: ST_CamMasterData; (* position information of the lower bound master position *)
MasterHigh: ST_CamMasterData; (* position information of the upper bound master position *)
END_VAR
```

| Done | Becomes TRUE, if the coupling was successful and the cam plate is active. |
|------------|--|
| Busy | The <i>Busy</i> output becomes TRUE when the command is started with <i>Execute</i> and remains TRUE as long as the command is processed. When <i>Busy</i> becomes FALSE again, the function block is ready for a new command. At the same time one of the outputs, <i>Done</i> or <i>Error</i> , is set. |
| Error | Becomes TRUE, as soon as an error occurs. |
| ErrorID | If the error output is set, this parameter supplies the error number. |
| MasterLow | Master position is smaller than the MasterStartPosition in the data structure ST CamMasterData [\blacktriangleright 69] |
| MasterHigh | Master position is smaller than the MasterStartPosition in the data structure ST CamMasterData [\blacktriangleright 69] |

7 Data type

7.1 Data type MC_CAM_ID

: UDINT;

TYPE MC_CAM_ID END_TYPE

Type definition for the tables ID.

7.2 Data type MC_CAM_REF

| TYPE MC CAM REF | : | |
|-----------------|---|--------------|
| STRUCT | | |
| pArray | : | UDINT; |
| ArraySize | : | UDINT; |
| TableType | : | MC_TableType |
| NoOfRows | : | UDINT; |
| NoOfColumns | : | UDINT; |
| END_STRUCT | | |
| END_TYPE | | |
| | | |

The data structure *MC_CAM_REF* describes the data memory of a cam plate in a further PLC variable (array).

The first parameter *pArray* is a pointer to a data structure containing the cam plate data. The data structure depends on the table type *nTableType*. The number of rows is entered in the component nNoOfRows, the number of columns in nNoOfCols (usually 1 or 2).

| Table 1: Example 1: Position table structure description | Table 1: Example | 1: Position table | e structure description |
|--|------------------|-------------------|-------------------------|
|--|------------------|-------------------|-------------------------|

| pArray | Address of a two-dimensional array. The first column contains an ascending list of master positions. The second column contains the associated slave positions. The address can be assigned with the ADR function. Example: Table1 : ARRAY[0360, 01] OF LREAL; pArray := ADR(Table1); |
|-------------|--|
| ArraySize | Storage capacity of the two-dimensional array, which can be determined with the SIZEOF function. Example: ArraySize := SIZEOF(Table1); |
| TableType | The table <u>type [▶ 66]</u> is MC_TABLETYPE_EQUIDISTANT, if the master positions have the same distance, or MC_TABLETYPE_NONEQUIDISTANT it the distance is variable. |
| NoOfRows | The number or rows corresponds to the number of table points. |
| NoOfColumns | The number of columns is 2. |

Table 2: Example 2: Structure description of a motion function

| pArray | Address of a one-dimensional array of type <u>MC MotionFunctionPoint. [> 61]</u> Each array element contains a description of a cam plate interpolation point. |
|-------------|--|
| | Example: MotionFunction : ARRAY[110] OF MC_MotionFunctionPoint; pArray := ADR(MotionFunction); |
| ArraySize | Storage capacity of the one-dimensional array, which can be determined with the SIZEOF function. Example: ArraySize := SIZEOF(MotionFunction); |
| TableType | The table type is MC_TABLETYPE_MOTIONFUNCTION. |
| NoOfRows | The number or rows corresponds to the number of table points. |
| NoOfColumns | The number of columns is 1. |

7.3 Data type MC_CamActivationMode

```
TYPE MC CamActivationMode :
   (* instantaneous change *)
  MC_CAMACTIVATION_INSTANTANEOUS,
   (* modify the data at a defined master position referring to the cam tables master position *)
  MC CAMACTIVATION ATMASTERCAMPOS,
   (* modify the data at a defined master position referring to the absolute master axis position *)
  MC CAMACTIVATION ATMASTERAXISPOS
   (* modify the data at the beginning of the next cam table cycle *)
  MC CAMACTIVATION NEXTCYCLE,
   (* not yet implemented!
  modify the data at the beginning of the next cam table cycle, activation is valid for one cycle
only *)
  MC CAMACTIVATION NEXTCYCLEONCE,
   (* modify the data as soon as the cam table is in a safe state to change its data *)
  MC_CAMACTIVATION_ASSOONASPOSSIBLE,
   (* don't accept any modification *)
  MC CAMACTIVATION OFF,
   (* delete all data which was written to modify the cam table but is still not activated *)
  MC CAMACTIVATION DELETEQUEUEDDATA,
   (* special mode at a defined master axis position in a defined positive direction *)
  MC CAMACTIVATION ATMASTERAXISPOS POSITVEDIRECTION,
   (* special mode at a defined master axis position in a defined negative direction *)
  MC CAMACTIVATION ATMASTERAXISPOS NEGATIVEDIRECTION
) :
```

```
END_TYPE
```

MC_CamActivationMode specifies the timing and type of change for a cam plate. Changes can be affected through scaling, modification of the cam plate data, or switching of cam plates.

The following modes are possible:

Scaling of cam plates

Cam plates can be scaled with the function block <u>MC CamScaling [> 18]</u>. The following activation modes are available.

| MC_CAMACTIVATION_INSTANTANEOUS | Scaling takes effect immediately. |
|--------------------------------------|---|
| MC_CAMACTIVATION_ATMASTERCAMPO S | Scaling takes effect at a certain cam plate position (master position within the cam plate). The scaling command must be issued ahead of this position. The position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| MC_CAMACTIVATION_ATMASTERAXISP OS | Scaling takes effect at a certain absolute position of the master axis. The scaling command must be issued ahead of this position. |
| MC_CAMACTIVATION_NEXTCYCLE | For a cyclic cam plate, scaling takes effect at the transition to the next period. |
| MC_CAMACTIVATION_OFF | No scaling is carried out. This can be used to limit scaling to one axis (master or slave), for example. |

Setting the mode for changing a cam plate online (writing of point data)

<u>MC SetCamOnlineChangeMode</u> [> <u>39</u>] is used to specify when modified cam plate data become active (see also <u>MC WriteMotionFunction</u> [> <u>36</u>] and <u>MC WriteMotionFunctionPoint</u> [> <u>38</u>]).

In both cases the following modes are possible:

| MC_CAMACTIVATION_INSTANTANEOUS | The change takes effect immediately. |
|---------------------------------------|---|
| MC_CAMACTIVATION_ATMASTERCAMPO S | The change takes effect at a certain cam plate position (master position within the cam plate). The command must be issued ahead of this position. The position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| MC_CAMACTIVATION_ATMASTERAXISP OS | The change takes effect at a certain absolute position of the master axis. The command must be issued ahead of this position. |
| MC_CAMACTIVATION_NEXTCYCLE | For a cyclic cam plate, the change takes effect at the transition to the next period. |
| MC_CAMACTIVATION_ASSOONASPOSSI BLE | Modified cam plate data take effect as soon as system dynamics allow. |
| MC_CAMACTIVATION_OFF | Changes in cam plate data are ignored. |
| MC_CAMACTIVATION_DELETEQUEUEDD | Queued cam plate data are deleted. Data are queued if the change was requested at a certain master position or at the end of the cycle, for example. |

Coupling with cam plates

The function block <u>MC CamIn [\blacktriangleright 12]</u> can be used to couple axes with cam plates. *ActivationMode* can optionally be used to specify from which position the slave axis becomes active.

| MC_CAMACTIVATION_INSTANTANEOUS | Cam plate coupling takes effect immediately, and the slave moves according to the cam plate data. |
|--|---|
| MC_CAMACTIVATION_ATMASTERCAMPO S | Cam plate coupling activation is suspended. The slave only moves from a defined cam plate position (master position within the cam plate) according to the cam plate data. In coupling mode, the <i>ActivationMode</i> cannot be used in conjunction with <u>MC_StartMode</u> [▶ 67] = MC_STARTMODE_RELATIVE or MC_STARTMODE_MASTERREL_SLAVEABS. The position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| MC_CAMACTIVATION_ATMASTERAXISP OS | Cam plate coupling activation is suspended. The slave only moves from a defined absolute position of the mster axis according to the cam plate data. |
| MC_CAMACTIVATION_NEXTCYCLE | Cam plate coupling activation is suspended. The slave moves from the next cycle transition (for cyclic cam plates). In coupling mode, the <i>ActivationMode</i> cannot be used in conjunction with <u>MC_StartMode</u> [▶ 67] = MC_STARTMODE_RELATIVE or MC_STARTMODE_MASTERREL_SLAVEABS. |
| MC_CAMACTIVATION_ATMASTERAXISP OS_POSITVEDIRECTION | The cam will be activated when the master overruns the defined position in positive direction |
| MC_CAMACTIVATION_ATMASTERAXISP OS_NEGATIVEDIRECTION | The cam will be activated when the master overruns the defined position in negative direction |

Switching of cam plates

The function block <u>MC CamIn [\triangleright 12]</u> can be used to switch between cam plates in coupled state. *ActivationMode* can be used to specify from which position the changeover takes place.

| The cam plate is switched immediately, and the slave moves according to the new cam plate data. |
|---|
| Cam plate switching takes place at a defined cam plate position (master position within the cam plate). The position refers to the non-scaled cam plate. If the position in the application refers to the scaled cam plate, it can be divided by the <i>MasterScaling</i> before the function block is called. |
| Cam plate switching takes place at a defined absolute master axis position. |
| For cyclic cam plates cam plate switching takes place at the next cycle transition. For linear cam plates the switchover takes place at the edges of a defined region. |
| A suspended cam plate switching process that has not been activated is discarded. |
| The cam will be activated when the master overruns the defined position in positive direction |
| The cam will be activated when the master overruns the defined position in negative direction |
| |

7.4 Data type MC_CamScalingMode

```
TYPE MC_CamScalingMode :
(
    (* user defines scaling parameters -scaling and -offset *)
    MC_CAMSCALING_USERDEFINED,
    (* offset is calculated automatically for best result *)
    MC_CAMSCALING_AUTOOFFSET,
    (* no modification accepted *)
    MC_CAMSCALING_OFF
);
END_TYPE
```

Type and scope of the scaling of a cam plate coupling via function block MC CamScaling [18].

MC_CAMSCALING_USERDEFINED : The scaling and offset are retained unchanged. The user has to calculate the scaling and offset such that a jump in the position is avoided.

MC_CAMSCALING_AUTOOFFSET: The scaling takes effect and the system adjusts the offset such that a jump in the position is avoided. Scaling should nevertheless occur during a phase with slave velocity 0, since otherwise a jump in velocity cannot be avoided.

MC_CAMSCALING_OFF : The scaling and offset are ignored. This mode is used when only slave scaling (i.e. without master scaling) is to be implemented.

Autooffset

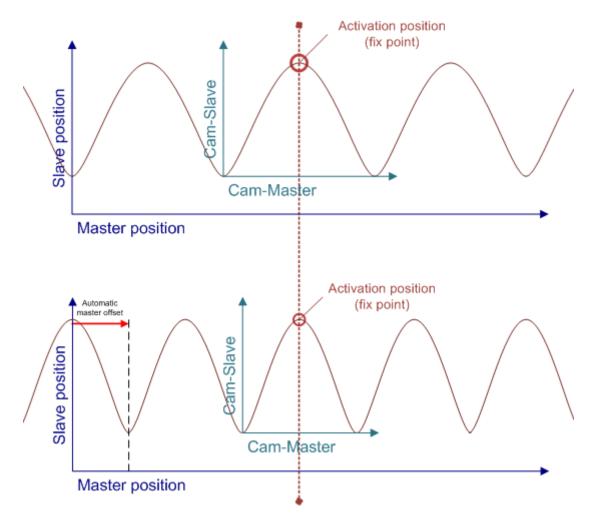

Autooffset mode ensures automatic adaptation of a cam plate offset. Autooffset can be used independently for the master or slave axis of a cam plate and affects both switchover and scaling of cam plates. The function operates based on the rules described below.

Master-Autooffset

Master-Autooffset Prevents discontinuity of the master position of the cam plate in the axis coordinate system during switching of cam plates with different master cycle or scaling of cam plates (master scaling). This function is required because the relative position of a cam plate in the axis coordinate system depends on the master cycle. If the master cycle is changed, e.g. through scaling, the position would change.

Master-Autooffset always needs an existing cam table to refer to and can therefore not be used with an initial coupling operation. *Master-Autooffset* determines the master offset of the cam plate such that the master position within the cam plate is maintained. For scaling or switchover to a cam plate with a different master cycle this means that the relative (percentage) position before and after the switchover is identical.

Example: A cam plate has master cycle of 360° and is scaled by a factor of 2 to 720°. Scaling takes place at the 90° position within the cam plate, i.e. at 25% of the start of a cycle. After the scaling the relative master position in the cam plate at 180° is therefore also 25% of the start of a cycle.

During a switchover at the edges of a cam plate (see <u>MC CamActivationMode</u> [<u>53]</u>*MC_CAMACTIVATION_NEXTCYCLE*), Master-Autooffset ensures a seamless sequence of cam plates, both for cyclic and linear cam plates.

Master-Autooffset cannot be used for a cam plate with relative coupling or switching, since these functions are mutually exclusive. Further restrictions apply to initial coupling. These are shown in the following table.

| | | Coupling with Cam Tables | | | | |
|---------------------|-------------------------|--------------------------|--------------|------------------------|----------|--|
| Master-ScalingMode: | | without Maste | r-AutoOffset | with Master-AutoOffset | | |
| | StartMode: | Absolute | Relative | Absolute | Relative | |
| | Instantaneous (default) | ٧ | ٧ | - | — | |
| Mode | AtMasterAxisPos | ٧ | V | _ | — | |
| | AtMasterCamPos | ٧ | - | _ | — | |
| Activation | NextCycle | ٧ | - | _ | — | |
| Acti | DeleteQueuedData | — | - | _ | — | |

| | | Switching of Cam Tables | | | | |
|---------|-------------------------|---------------------------|----------|------------------------|----------|--|
| | Master-ScalingMode: | without Master-AutoOffset | | with Master-AutoOffset | | |
| | StartMode: | Absolute | Relative | Absolute | Relative | |
| ę | Instantaneous (default) | ٧ | ٧ | ٧ | — | |
| Mode | AtMasterAxisPos | ٧ | ٧ | ٧ | — | |
| ivation | AtMasterCamPos | ٧ | V | ٧ | — | |
| Active | NextCycle | ٧ | ٧ | ٧ | _ | |
| 4 | DeleteQueuedData | ٧ | V | V | — | |

Slave-Autooffset

Slave-Autooffset calculates a slave offset such that discontinuities in the slave position are avoided during cam plate switching or scaling. The slave offset is adjusted to ensure that the slave position is identical before and after the action.

If both *Master Autooffset* and *Slave-Autooffset* are used for cam plate switching or scaling, the master offset is calculated first, followed by the slave offset.

Slave-Autooffset can be used with any <u>MC_StartMode [\blacktriangleright 67]</u> and will always adjust the cam plate such that the slave position doesn't jump.

7.5 Data type MC_CamInfoData

```
TYPE MC CamInfoData :
STRUCT
       Execute
                                                                               : BOOL;
       TableType
                                                                               : MC_TableType;
       Periodic
                                                                               : BOOL;

       CamExchangeSlaveScalingMode : MC CamScalingMode;
END STRUCT
END_TYPE
```

The data structure *MC_CamInfoData* contains data on the current state of a cam plate coupling. The data are determined with the function block <u>MC_CamInfo</u> [\blacktriangleright 45].

The structure contains absolute axis positions relating to the master or slave axis coordinate system. It also contains cam plate positions relating to the cam plate coordinate system refer (e.g. *ActualMasterCamPos* and *ActualSlaveCamPos*). All cam positions relate to the non-scaled cam plate coordinate system and can be converted to the scaled coordinate system, if required. A master cam position can be multiplied with the *MasterScaling* factor, a slave cam position can be multiplied with the *SlaveScaling* factor.

The activation positions (*ActivationPos*) relate to the master axis coordinate system or the cam plate coordinate system, depending on the *ActivationMode*. In the latter case non-scaled cam plate positions are specified.

7.6 Data type MC_InterpolationType

Interpolation mode for position tables (cam plates). Position tables consist of a list of master and slave positions between which interpolation can take place in different ways.

The interpolation type is not used for extended cam plates (motion functions).

```
TYPE MC_InterpolationType :
(
    (* linear 2 point interpolation *)
    MC_INTERPOLATIONTYPE_LINEAR := 0,
    (* no longer supported - 4 point interpolation (for equidistant tables only) *)
    MC_INTERPOLATIONTYPE_4POINT := 1,
    (* spline interpolation (tangential or cyclic depending on table) *)
    MC_INTERPOLATIONTYPE_SPLINE := 2,
    (* moving cubic spline interpolation with n sampling points ('local spline') *)
    MC_INTERPOLATIONTYPE_SLIDINGSPLINE := 3
);
END TYPE
```

7.7 Data type MC_MotionFunctionPoint

TYPE MC_MotionFunctionPoint :

| SIRUCI | |
|-------------------|------------------------------|
| PointIndex | : MC_MotionFunctionPoint_ID; |
| FunctionType | : MC MotionFunctionType; |
| PointType | : MC_MotionPointType; |
| RelIndexNextPoint | : MC_MotionFunctionPoint_ID; |
| MasterPos | : LREAL; (* X *) |
| SlavePos | : LREAL; (* Y *) |
| SlaveVelo | : LREAL; (* Y' *) |
| SlaveAcc | : LREAL; (* Y'' *) |
| SlaveJerk | : LREAL; (* Y''' *) |
| END_STRUCT | |
| END_TYPE | |
| | |

The data structure *MC_MotionFunctionPoint* describes a interpolation point of a motion function. A motion function is a one-dimensional list (array) of type *MC_MotionFunctionPoint*.

PointIndex: Absolute index of this interpolation point within the motion function. The point index of all interpolation points must increase strictly monotonously and must have no gaps and be greater than 0.

FunctionType: Type <u>MC_MotionFunctionType</u> [<u>63</u>] of the mathematical function between this and the subsequent interpolation point

PointType: Type <u>MC_MotionPointType [> 64]</u> of this interpolation point.

RelIndexNextPoint: Relative reference to the subsequent interpolation point (usually 1).

MasterPos: Position of the master axis at this interpolation point

SlavePos: Position of the slave axis at this interpolation point

SlaveVelo: Velocity of the slave axis at this interpolation point

SlaveAcc: Acceleration of the slave axis at this interpolation point

SlaveJerk: Jerk of the slave axis at this interpolation point

7.8 Data type MC_MotionFunctionPoint_ID

TYPE MC_MotionFunctionPoint_ID : UDINT; END TYPE

Type definition for the point IDs for a motion function.

7.9 Data type MC_MotionFunctionType

TYPE MC_MotionFunctionType : (

| MOTIONFUNCTYPE_NOTDEF, | |

```

Type definition for the characteristic parameters of a motion function.

7.12 Data type MC_TableErrorCodes

TYPE MC_TableErrorCodes :

| | (* Cam Table Error Codes *) | | |
|---|------------------------------|----------------|--------------------------------------|
| | MC ERROR POINTER INVALID | := 16#4B30, (* | invalid pointer (address) value *) |
| | MC ERROR ARRAYSIZE INVALID | := 16#4B31, (* | invalid size of data structure *) |
| | MC ERROR CAMTABLEID INVALID | := 16#4B32, (* | invalid cam table ID (not [1255]) *) |
| | MC ERROR POINTID INVALID | := 16#4B33, (* | invalid point ID *) |
| | MC_ERROR_NUMPOINTS_INVALID | := 16#4B34, | |
| | MC ERROR MCTABLETYPE INVALID | := 16#4B35, | |
| | MC ERROR NUMROWS INVALID | := 16#4B36, | |
| | MC ERROR NUMCOLUMNS INVALID | := 16#4B37, | |
| | MC ERROR INCREMENT INVALID | := 16#4B38 | |
|) | | | |

, END TYPE

7.13 Data type MC_TableType

```
TYPE MC_TableType :
(
    (* n*m tabular with equidistant ascending master values *)
    MC_TABLETYPE_EQUIDISTANT := 10,
    (* n*m tabular with strictly monotone ascending master values (not imperative equidistant) *)
    MC_TABLETYPE_NONEQUIDISTANT := 11,
    (* motion function calculated in runtime *)
    MC_TABLETYPE_MOTIONFUNCTION := 22
);
END_TYPE
```

7.14 Data type MC_ValueSelectType

```
TYPE MC_ValueSelectType :
(
    (* a bitmask can be created by adding the following values *)
    MC_VALUETYPE_POSITION := 1,
    MC_VALUETYPE_VELOCITY := 2,
    MC_VALUETYPE_ACCELERATION := 4,
    MC_VALUETYPE_JERK := 8
);
END TYPE
```

Type definition for access to value tables with the function block <u>MC ReadMotionFunctionValues [▶ 41]</u>.

7.15 Data type MC_StartMode

TYPE MC_StartMode :

```
(
    MC_STARTMODE_ABSOLUTE := 1, (* cam table is absolute for master and slave *)
    MC_STARTMODE_RELATIVE := 2, (* cam table is relative for master and slave *)
    MC_STARTMODE_MASTERABS_SLAVEREL := 3, (* cam table is absolute for master and relative for slave
*)
    MC_STARTMODE_MASTERREL_SLAVEABS := 4 (* cam table is relative for master and absolute for slave
*)
);
END_TYPE
```

StartMode is used for coupling with cam plates through <u>MC CamIn [\blacktriangleright 12]</u> and defines whether a cam plate is interpreted absolute (based on the origin of the axis coordinate system) or relative to the coupling position. The mode can be specified as absolute or relative separately for both coordinate axes.

With *StartModeabsolute* the cam plate coordinate system is congruent with the axis coordinate system and can be moved through an offset, if required (master or slave offset).

With *StartModerelative* the origin of the cam plate coordinate system is at the axis position of the respective axis (master or slave) at the time of coupling or cam plate switching. The cam plate can additionally be moved through an offset.

Note : The modes MC_STARTMODE_RELATIVE and MC_STARTMODE_MASTERREL_SLAVEABS cannot be used in conjunction with automatic master offset calculation (<u>MC_CamScalingMode [\$ 56]</u>), since this would cause a conflict.

7.16 Data type ST_CamInOptions

Data of type ST_CamInOptions can be transferred optionally to the function block MC_CamIn [12].

```
TYPE ST_CamInOptions :
STRUCT
  (* ActivationMode defines when and where the cam table will be activated *)
  (* (only valid if slave is already coupled and cam table will be exchanged) *)
  ActivationMode : MC_CamActivationMode := MC_CAMACTIVATION_INSTANTANEOUS;
  ActivationPosition : LREAL;
  (* Scaling Modes enable, disable or define the way of scaling the cam table *)
  MasterScalingMode : MC_CamScalingMode := MC_CAMSCALING_USERDEFINED;
  SlaveScalingMode : MC_CamScalingMode := MC_CAMSCALING_USERDEFINED;
  (* InterpolationType is required for position tables only. *)
  (* MotionFunctions don't need an InterpolationType *)
  InterpolationType : MC_InterpolationType := MC_InterpolationType_Linear;
  END_STRUCT
  END_TYPE
```

7.17 Data type CamMasterData

Data of type CamMasterData are optionally transferred by function block <u>MC_ReadCamTableMasterPosition</u> [<u>48]</u>.

```
TYPE CamMasterData :

STRUCT

Valid : BOOL; (* position information is valid *)

MasterAxisPosition : LREAL; (* absolute master axis position *)

MasterCamPosition : LREAL; (* local master cam position *)

SlaveOffset : LREAL; (* slave cam offset corresponding to the master position *)

END_STRUCT

END_TYPE
```

7.18 Data type MC_CamOperationMode

The *CamOperationMode* is used for managing couplings with superimposed cam plates with the function block <u>MC CamIn V2 [▶ 20]</u> (multi-cam). Cam plates can be added, switched or removed.

```
TYPE MC_CamOperationMode :
```

```
(
   CAMOPERATIONMODE_DEFAULT, (* same as additive *)
   CAMOPERATIONMODE_ADDITIVE, (* additive cam in a multi cam scenario *)
   CAMOPERATIONMODE_EXCHANGE, (* exchange existing cam in a multi cam scenario *)
   CAMOPERATIONMODE_REMOVE (* remove cam from a multi cam scenario *)
);
END TYPE
```

7.19 Data type ST_CamScalingData

The structure *ST_CamScalingData* contains information for scaling a cam plate and is used with the function block <u>MC_CamIn_V2</u> [▶ 20].

```
TYPE ST_CamScalingData :

STRUCT

(* scaling of the X axis of the cam (master scaling) *)

MasterScalingMode : MC_CamScalingMode;

MasterRelative : BOOL;

MasterOffset : LREAL;

MasterScaling : LREAL := 1.0;

(* scaling of the Y axis of the cam (slave scaling) *)

SlaveScalingMode : MC_CamScalingMode;

SlaveRelative : BOOL;

SlaveOffset : LREAL;

SlaveScaling : LREAL := 1.0;

END_STRUCT

END_TYPE
```

| MasterScalingMode | Scaling mode [> 56] for the master position of the cam plate |
|-------------------|---|
| MasterRelative | If TRUE the cam plate operates relative to the current master position at the time of activation. |
| MasterOffset | Master offset for orientation of the cam plate in the axis coordinate system. <i>MasterOffset</i> takes effect in absolute mode from the master axis position 0 and in relative mode from the current position at the time of activation. |
| MasterScaling | Scaling of the master position of the cam plate. Default is 1.0 |
| SlaveScalingMode | Scaling mode [> 56] for the slave position of the cam plate |
| SlaveRelative | If TRUE the cam plate operates relative to the current slave position at the time of activation. |
| SlaveOffset | Slave offset for orientation of the cam plate in the axis coordinate system. <i>SlaveOffset</i> takes effect in absolute mode from the slave axis position 0 and in relative mode from the current position at the time of activation. |
| SlaveScaling | Scaling of the slave position of the cam plate. Default is 1.0 |

8 Example programs

Electronic Cam Tables

The example program couples a master and a slave axis via cam plates. During the coupled movement cam plates are switched, individual sampling points of a cam plate are modified, and the cam plate is scaled.

The example program requires the additional TcMC2_Camming.lib library and operates fully in simulation mode. Progress can be monitored in TwinCAT Scope View with the configuration provided.

Click here to save the example program:

twincat nc sample camming.zip (Resources/zip/18014398969961355.zip)

Rotary Knife and Registration

The sample uses a rotational knife to cut sheets of a defined length. For this purpose the circumference speed must be synchronized with the web while cutting a sheet. The rotation knife must the accelerator or deceleration since the circumference of the knife is different from the sheet length. Registration marks are used to synchronize with the product. The knife is continuously adjusted to compensate small differences caused by temperature or stretching.

An electronic cam table is used to synchronize the rotational knife with the material. The cam table is a normalized cam table defined with a length of 360°. The tool moves over a full turn while the cam table is executed and the cut position is defined as 0°. The circumference speed is synchronous from 270° to 30°. The range from 30° to 270° is used to adjust the operation to the actual distance of registration marks.
